Opportunity Knocks

Broadband wireless technology from SpectraPoint Wireless takes you into the new generation of communications networks.

It's called the New World Network, and it is a data network based on Internet technology. It is a converged network – voice, video and data traveling over a single global network. It is the future of communications, and it's here now. LMDS from SpectraPoint Wireless gives you easy access to this new world.

It's no secret that we have a taste for speed. We want information, connection, transaction, faster and faster. We also want more and better services...advanced telephony, Internet access, high-speed data transfer, video entertainment services. The long-haul can respond with all the speed we need. The problem is that the installed copper networks of the Local Exchange Carriers have reached their limits. But the problem is also the opportunity. LMDS accommodates New World services by opening a high-speed highway in the local loop.

Now, with 1300 MHz of spectrum, SpectraPoint's LMDS systems provide flexible, economical, short-haul communications. Instead of months or years to install copper or fiber optic cable, LMDS wireless technology is installed in a matter of days. And it's fully digital and two-way, with reliability comparable to cabled networks.

SpectraPoint's scalability makes building a business case easy. Start with areas of concentrated users, perhaps a mix of MDUs (multiple dwelling units) and office buildings. As the business grows, add areas of lesser concentration like small businesses and Small Operator and Home Office (SOHO) users. Add a high-volume account. Add wholesale PCS/cellular backhaul. Custom service offerings can be configured at any time.

What if the business climate changes? A major customer moves away, a complex is leveled, a large customer moves into the area. Simple. Just move the CPE (Customer Premise Equipment.) There are no stranded investments with SpectraPoint's LMDS.

The New World Network demands speed, flexibility and fast deployment. LMDS by SpectraPoint answers...and more!
